Are Italy's and Germany's economic strategies competitive or complementary?

Paolo Guerrieri Professor of Economics University of Rome 'La Sapienza' College of Europe, Bruges, Belgio Centro Europa Ricerche Piero Esposito Post Doctoral Researcher Sant'Anna School of Advanced Studies and Centro Europa Ricerche

Competitiveness in Europe: confronting Italy and Germany Residence Ripetta, Rome, 11-12 July 2011

Content

- Exports have been Germany's and Italy's main engine
- > Two different performers in the last decade

> The net export have been differently contributing to the two countries' performances

> The traditional explanation based on the different evolutions of international competitiveness

Structural peculiarities such as the different degree of openness of Germany and Italy are equally relevant

> On the supply side and demand side Germany has been positively adapting to the last decade's globalization.

> Yet the German model is highly dependent on foreign demand and excessive current-account surplus versus the Euro area

> The common challenges ahead: competing in the global economy and membership of the euro area

Geographical concentration index for exports (share of export to area *i* on the share of Eu exports to area *i*)

Fragmentation and export performance: econometric analysis

- We estimate the effect of fragmentation and labor costs on the net sectoral exports of Germany and Italy;
- As measure of fragmentation we take the share of intermediate goods in total export (trade) of sector i;
- In addition, we introduce the fragmentation index for CEEC4, rest of NMS and Asia in order to check whether the effect may be driven by some specific areas; in particular, according to the descriptive evidence, CEEC4 should play a major role as fragmentation destination;

Fragmentation and export performance: econometric analysis (follows)

- Trade data are collected from the Comext database (Eurostat) at product level (HS 6 digits) and then aggregated into 14 manufacturing industries (NACE DA-DN);
- Other variables include the domestic sectoral GDP and labor compensation (source: EUKLEMS);
- The regression is implemented using the Fixed Effect estimator over the period 1992-2007;
- The estimation is estimated in first differences in order to avoid non stationarity problems;

Estimation results: Germany

Real Exchange Rates Intra-Euro

(1999=100)

Source: Ameco

Demand side effects: econometric analysis

- We estimate the demand effect using a panel of bilateral net exports with 86 partners (source: CEPII Chelem), covering between 92% and 98% of total German and Italian trade; the time span runs from 1992 to 2008;
- The Euro Area effect is captured by a dummy=1 if the partner uses Euro or has a fixed exchange rate with Euro;
- The Euro dummy is then interacted with the partner's real GDP in order to capture a regime shift for the demand elasticity;
- Estimation method: panel fixed effect
- Domestic GDP and labor costs, as well as bilateral distance are not included because of collinearity with the fixed effects;
- The equation is estimated in difference because of the non stationarity of the original series;
